# Undermining Ethical Decision-Making

What makes these findings so striking is just how insubstantial the situational influences seem to be; people fail to adhere to standards for good conduct, and *they can be induced to do so with such ease*.

# Semi-Automated Decision-Making Process with Questionable Human Control

# Designing for Meaningful Human Control

- Need to:
  - understand the effects of automating critical functions
  - understand the relationship between design features and human moral psychology

# Way Forward

Identify exemplary cases of meaningful human control and use them as a basis for further study.
